FOREWORD

In Part I of this report (Schwiderski, 1978a), a combined hydrodynamical-empirical method was introduced to compute numerically harmonic partial tides in the world oceans with an accuracy of better than 5 cm, which is needed in various military and civil applications of today. In this report, the computed semidiurnal luni-solar declination tide (K_2) is displayed in an atlas of tabulated tidal charts and plotted corange and cotidal maps.

This project was supported by the Naval Surface Weapons Center's Independent Research Fund and by a grant from the National Geodetic Survey of the Department of Commerce/NOS/NOAA.* It is the author's most pleasant obligation to acknowledge the sustained and generous sponsorship of Mr. R. T. Ryland, Jr., Head of the Strategic Systems Department, his Associate, Mr. R. J. Anderle, and Mr. D. R. Brown, Jr., Head of the Space and Surface Systems Division. Many critical and stimulating suggestions were gratefully received from the author's colleagues, Drs. C. J. Cohen, C. Oesterwinter, and B. Zondek. The involved computer programs were all prepared by Mr. L. T. Szeto in a competent and effective manner.

The date of completion was June 1, 1981.

ABSTRACT

In Part I (Schwiderski, 1978a) of this report, a unique hydrodynamical interpolation technique was introduced, extensively tested, and evaluated in order to compute partial global ocean tides in great detail and with a high degree of accuracy. This novel method has been applied to construct the semidiurnal luni-solar declination (K_2) ocean tide with a relative accuracy of better than 5 cm anywhere in the open oceans. The resulting tidal amplitudes and phases are tabulated on a $1^\circ \times 1^\circ$ grid system in an atlas of $42^\circ \times 71^\circ$ overlapping charts covering the whole oceanic globe. A corresponding atlas of global corange and cotidal maps is included to provide the reader with a quick general overview of the major tidal phenomena. The specifying hydrodynamical parameters of the model are listed along with quoted sources of empirical tide data, and significant tidal features are explained and discussed. As expected, since the periods of the semidiurnal K_2 (11.97 h) and S_2 (12.00 h) tides differ by only 0.03 h, these two tides are almost copies of each other (compare Part III). Some differences occur only in areas with rapid tidal variations.

1. INTRODUCTION

Part I of this report (Schwiderski, 1978a) introduced a unique combination of hydrodynamical and empirical methods to model detailed ocean tides with a relative component accuracy of better than 5 cm anywhere in the open oceans. This enormous accuracy is well above minimum requirements set by, for instance, the National Aeronautics and Space Administration (NASA) and the Department of Defense (DoD) -- to map the geoid at sea by satellite altimetry to within 10 cm. The following features of this unique hydrodynamical interpolation model made the achievement of this accuracy possible.

a. A spherically graded $1^\circ \times 1^\circ$ grid system is set up in connection with a corresponding $1^\circ \times 1^\circ$ bathymetry to assure a sufficient resolution of all important tidal phenomena.

b. The bathymetry of the gridwise, simply connected ocean basin is hydrodynamically defined (Schwiderski, 1978c) by appropriate modifications of earlier realistic depth data collections. The hydrodynamical redefinition was needed in order to model the well-known strong distortion and retardation effects of shallow continental shelves, narrow ocean ridges or island chains, and other significant bottom irregularities.

c. The Boussinesq substitution of the turbulent Reynolds stresses is applied in the form of eddy dissipation with a novel physically meaningful eddy viscosity that depends linearly on the lateral grid-cell area and, hence, directly on the ocean depth.

d. The linear law of bottom friction is introduced with a bottom-friction coefficient depending linearly on the bottom grid-cell area which is independent of the ocean depth. In boundary cells, the otherwise constant friction coefficient is subjected to an indirect cellwise adjustment in order to permit a consistent hydrodynamical interpolation (see h., below) of empirical tide data known from tide gauge stations at continental shores, islands, or other shallow-ocean bottom irregularities.

e. The effects of the terrestrial tide and the oceanic tidal load are included as simple second-order approximations in the sense of Love and Accad and Pekeris (1978).

f. The Hansen-Zahel (Zahel, 1970 and 1977; Estes, 1977) finite differencing technique is modified by a new differencing scheme in time which improved decay, dispersion, and stability characteristics of the numerical procedure and facilitates the simple indirect adjustment of the bottom-friction coefficient in the hydrodynamical interpolation technique (see d. and h.).

g. At land-ocean cell walls, the conditions of no-flow across and free-slip along the boundaries are enforced. The no-flow condition is subsequently relaxed by allowing controlled periodic inflows and outflows over the mathematically assumed boundaries. This allowance redefines indirectly more realistic shorelines in order to further improve the consistency of the hydrodynamical interpolation of empirical data (see d. and h.).

h. A unique hydrodynamical interpolation technique is introduced which incorporates into the theoretical model empirical tidal constants collected from over 2 000 tide-gauge stations around the world in a hydrodynamically consistent fashion (see d., f., and g., above).

i. A new higher order approximation of Arctic Ocean tides is used, that is described in Schwiderski (1981f).

With these features, the new model was successfully applied to chart the semidiurnal principal lunar (M_2) ocean tide with the desired accuracy. The technique and accuracy of the model were extensively described and discussed in Part I of this report as well as in subsequent publications and symposia presentations by the author (Schwiderski 1978a, b; 1979a, b, c, d, e; and 1980).

The same hydrodynamical interpolation technique has been applied to chart the semidiurnal luni-solar declination (K_2) ocean tide with the same relative accuracy as M_2 . Again, it must be emphasized that the enormous accuracy achieved over all open ocean regions diminishes somewhat near coastal areas where known empirical data are marginal in quantity and/or quality.

A complete listing of all sources of empirical ocean tide data, which were interpolated into the K_2 tidal charts, is presented in Appendix A. In the meantime, Section 2 of this report lists the significant hydrodynamical input parameters that specified the constructed K_2 ocean tide. The major features of the global K_2 tide are discussed in Section 3. A complete numerical display is presented in Appendix A where all tidal amplitudes and phases are gridwise tabulated in map-like charts. Corange (equi-amplitude) and cotidal (equi-phase) maps of the K_2 ocean tide are plotted in Appendix B.

2. K_2 OCEAN-TIDE PARAMETERS

The astronomical semidiurnal luni-solar declination (K_2) equilibrium tide η (or tide-generating potential $G\eta$; see Schwiderski, 1978a) at the geographical point (λ, ϕ) and instant (Y, D, t) is determined by

$$\eta = K \cos^2 \phi \cos(\sigma t + \chi + 2\lambda) \quad (1)$$

where

$G = 9.81 \text{ m/sec}^2$ earth gravity acceleration

λ = longitude (east in rad)

ϕ = latitude (north in rad)

$Y (\geq 1975)$ = year number

D = day number of year Y ($D = 1$ for January 1)

t = universal standard time of day D (in sec)

$K = 0.030704 \text{ m} = K_2$ equilibrium tide amplitude

$\sigma = 1.45842 \cdot 10^{-4} \text{ sec}^{-1} = K_2$ tide frequency

$\chi = 2\pi h_0/180 = K_2$ astronomical argument (in rad)

$h_0 \begin{cases} = 279.69668 + 36000.768930485T + 3.03 \cdot 10^{-4} T^2 \\ = \text{mean longitude of the sun relative to Greenwich midnight of day } D \text{ (in deg)} \end{cases}$

$T = [27392.500528 + 1.000000356\bar{D}]/36525$

$\bar{D} = D + 365(Y - 1975) + \text{Int}[(Y - 1973)/4]$

$\text{Int}[x]$ = integral part of x

The corresponding instantaneous ocean partial tide (Schwiderski, 1978a) is determined by

$$\zeta = \xi \cos(\sigma t + \chi - \delta), \quad (2)$$

where the local harmonic constants

$\xi = \xi(\lambda, \phi) = K_2$ ocean tide amplitude (in m)

and

$\delta = \delta(\lambda, \phi) = K_2$ ocean tide Greenwich phase (in rad)

must be determined, say, by linear interpolation in the tidal charts of Appendix A.

A simple second-order approximation in the sense of Love and Accad and Pekeris (see Part I, Schwiderski, 1978a, 1979c, and 1980; and Accad and Pekeris, 1978) yields

$$\zeta^e \approx 0.612\eta \text{ and } \zeta^{eo} \approx -0.0667\zeta, \quad (3)$$

i.e., the corresponding terrestrial tide ζ^e and the earth dip ζ^{eo} (yielding) under the oceanic tidal load ζ , respectively. A more elaborate and probably slightly more accurate earth dip ζ^{eo} may be computed by using Farrell's Green function (see Farrell, 1972 and 1973; and Schwiderski, 1980). In linear superposition, one finds the corresponding instantaneous geocentric partial K_2 tide:

$$\zeta^g = \zeta + \zeta^e + \zeta^{eo}. \quad (4)$$

A detailed description of the hydrodynamical-empirical model to compute the ocean tidal amplitudes ξ and phases δ (listed in Appendix A) was given in Schwiderski (1978a, 1979c, d, and 1980). In particular, all model input parameters such as the dimensionless eddy coefficient ϵ (Eq's. 103 and 123), the bottom-friction parameter b (Eq's. 4a and b), and the differencing parameters κ and $\bar{\kappa}$ (Eq's. 64 and 72) were all specified in Schwiderski (1978a) (referenced equations). These parameters were determined for M_2 by extensive trial-and-error computations and remained unchanged for the construction of K_2 .

In the computation of the K_2 tide model, the following mode-dependent parameters were used (see referenced equations in Schwiderski, 1978a):

- a. The time step Δt (Eq's. 64, 123)

$$\Delta t = 179.5089 \text{ sec} \quad (5)$$

- b. The hydrodynamical interpolation control limits, k_1 , k_2 , and k_3 (Eq's. 88, 89, 94, 97, and 99)

$$k_1 = 0.045, k_2 = 0.045, k_3 = 0.5. \quad (6)$$

It may be noted that the input parameters k_1 and k_2 of Equation 6 are the same as for all semidiurnal M_2 , S_2 , and N_2 components, but differ from those values used for the diurnal K_1 , O_1 , and P_1 species (see Parts II through VII).

3. K_2 OCEAN-TIDE FEATURES

The entire constructed K_2 ocean tide is gridwise displayed in map-like amplitude and phase tables in Appendix A. The $42^\circ \times 71^\circ$ charts cover the whole globe north of colatitude 169° (Antarctica) in three zones: a northern zone N from 0° to 71° colatitude, a middle zone M from 48° to 118° colatitude, and a southern zone S from 98° to 168° colatitude. The overlapping geographical areas of the tidal charts have been chosen to provide a worldwide coverage for special applications and to allow the reader to scan the large amplitude and phase charts together in order to evaluate their quality and visualize the important tidal features. In addition, a generally superficial overview of some tidal features can be recognized by inspecting the more schematically plotted corange and cotidal maps provided in Appendix B.

For an easy evaluation of the tidal charts in Appendix A, all hydrodynamically interpolated empirical tidal amplitudes and phases have been visibly marked by subbars for all shore data and subbrackets for all near-shore deep-sea input constants. Furthermore, the charts display the approximate locations of distant off-shore deep-sea stations by subtildes under the computed amplitude and phase data. The corresponding empirical data, which were excluded from hydrodynamical interpolation (see Sect. 1 and Schwiderski, 1978a, 1979d, and 1980), are listed and compared with the modeled data in Tables 1, 2, and 3. Finally, the approximate geographical locations of the important amphidromic points of zero amplitudes are marked by a circled (X).

The tidal charts and maps permit the viewer to follow the tidal waves, that is the high water fronts (crests), in forward (or backward) direction, for instance, on their rotation around the amphidromic points. In the tidal phase charts of Appendix A, it is best to start from the prominently visible $0^\circ = 360^\circ$ or 100° cotidal lines. Since the Greenwich phases specify the time lags (in degrees: $30^\circ \approx 1$ hour) of the tidal crests relative to the cresting time of the corresponding equilibrium tide along Greenwich meridian, one gathers a vivid impression of the significant global and local tidal phenomena.

By following the tidal waves on their periodic rotations, one finds these waves passing through the specially marked stations in empirically correct time and with the correct height. In fact, all over the globe over 2 000 tidal phases and 2 000 amplitudes are coherently integrated. This is particularly impressive for the charts of the Pacific Ocean, where the empirical data from so many clustered and scattered island stations fit smoothly into the surrounding computed tides. From the smoothness features of erratically interpolated tidal data (see Parts I and II), one concludes that this result is not an artifact of the interpolation applied but constitutes a vivid manifestation of the excellent compatibility of both the empirical and hydrodynamical procedures combined.

On the basis of this observation, it can again (see Schwiderski, 1978a, b; 1979a, b, d, e; 1980, and 1981a – e) be estimated that the K_2 tidal charts permit a tide prediction with a uniform accuracy relative to M_2 of better than 5 cm anywhere in the open oceans. Naturally, near rough ocean basin reliefs (e.g., Arctic and Antarctic shores), where empirical tide (and depth) data

are marginal in quality and quantity, a somewhat lesser accuracy must be expected. The estimated accuracy of the computed K_2 tide is, of course, fully validated by all 32 empirical tide data from distant off-shore deep-sea tide gauge stations, which are listed along with the computed data in Tables 1, 2, and 3. The differences (not necessarily errors) range from 0 to 2 cm in amplitudes and 0° to 14° (24 minutes) in phases and thus verify the estimated prediction accuracy. In this connection one may recall the accuracy discussion of the deep-sea empirical data presented in Part IV of this report.

From the tidal charts and maps in Appendixes A and B, one concludes that the rotating tidal waves of the two semidiurnal tides K_2 and S_2 are almost copies of each other differing essentially only in a uniform proportionality amplitude factor (compare Part III and Schwiderski, 1979b). Of course, this resemblance was anticipated, since the corresponding periods of K_2 (11.97 h) and S_2 (12.00 h) differ only by 0.03 h (compare also Parts II, IV to VII).

4. CONCLUSIONS

The hydrodynamical interpolation technique has been applied to construct the semidiurnal luni-solar declination tide (K_2) with a relative accuracy of better than 5 cm anywhere in the open oceans. The constructed tide is displayed by tabulated charts in Appendix A and by corange and cotidal maps in Appendix B. The major features of the K_2 tide are discussed in Section 3. A comparison with the earlier computed semidiurnal S_2 tide reveals that those two tides are almost copies of each other.

APPENDIX A

**ATLAS OF $1^\circ \times 1^\circ$ K_2 OCEAN-TIDE AMPLITUDE
AND PHASE CHARTS FOR $42^\circ \times 71^\circ$ AREAS**

APPENDIX A

ATLAS OF $1^\circ \times 1^\circ K_2$ OCEAN-TIDE AMPLITUDE AND PHASE CHARTS FOR $42^\circ \times 71^\circ$ AREAS

1. GUIDE TO TIDAL CHARTS

- M = m : Longitude Number
 N = n : Colatitude Number
 λ_m = $(m - 0.5)^\circ$: Geographical Longitude East
 θ_n = $(n - 0.5)^\circ$: Geographical Colatitude
 $\xi_{m,n}$ = $\xi(\lambda_m, \theta_n)$: Amplitude (in mm)
 $\delta_{m,n}$ = $\delta(\lambda_m, \theta_n)$: Greenwich Phases (in deg.; $30^\circ \approx 1$ h)
 \otimes = Amphidromic Points
— = Subbars Mark Empirical Input Data at Shore Stations
┌ = Subbrackets Mark Empirical Input Data at Near-Shore Deep-Sea Stations
~ = Subtildes Mark Approximately Distant Offshore Deep-Sea Stations with Excluded Empirical Tide Data Listed in Tables 1, 2, and 3

2. SOURCES OF EMPIRICAL TIDE DATA

APPENDIX B

**ATLAS OF GLOBAL K_2 OCEAN-TIDE
CORANGE AND COTIDAL MAPS**

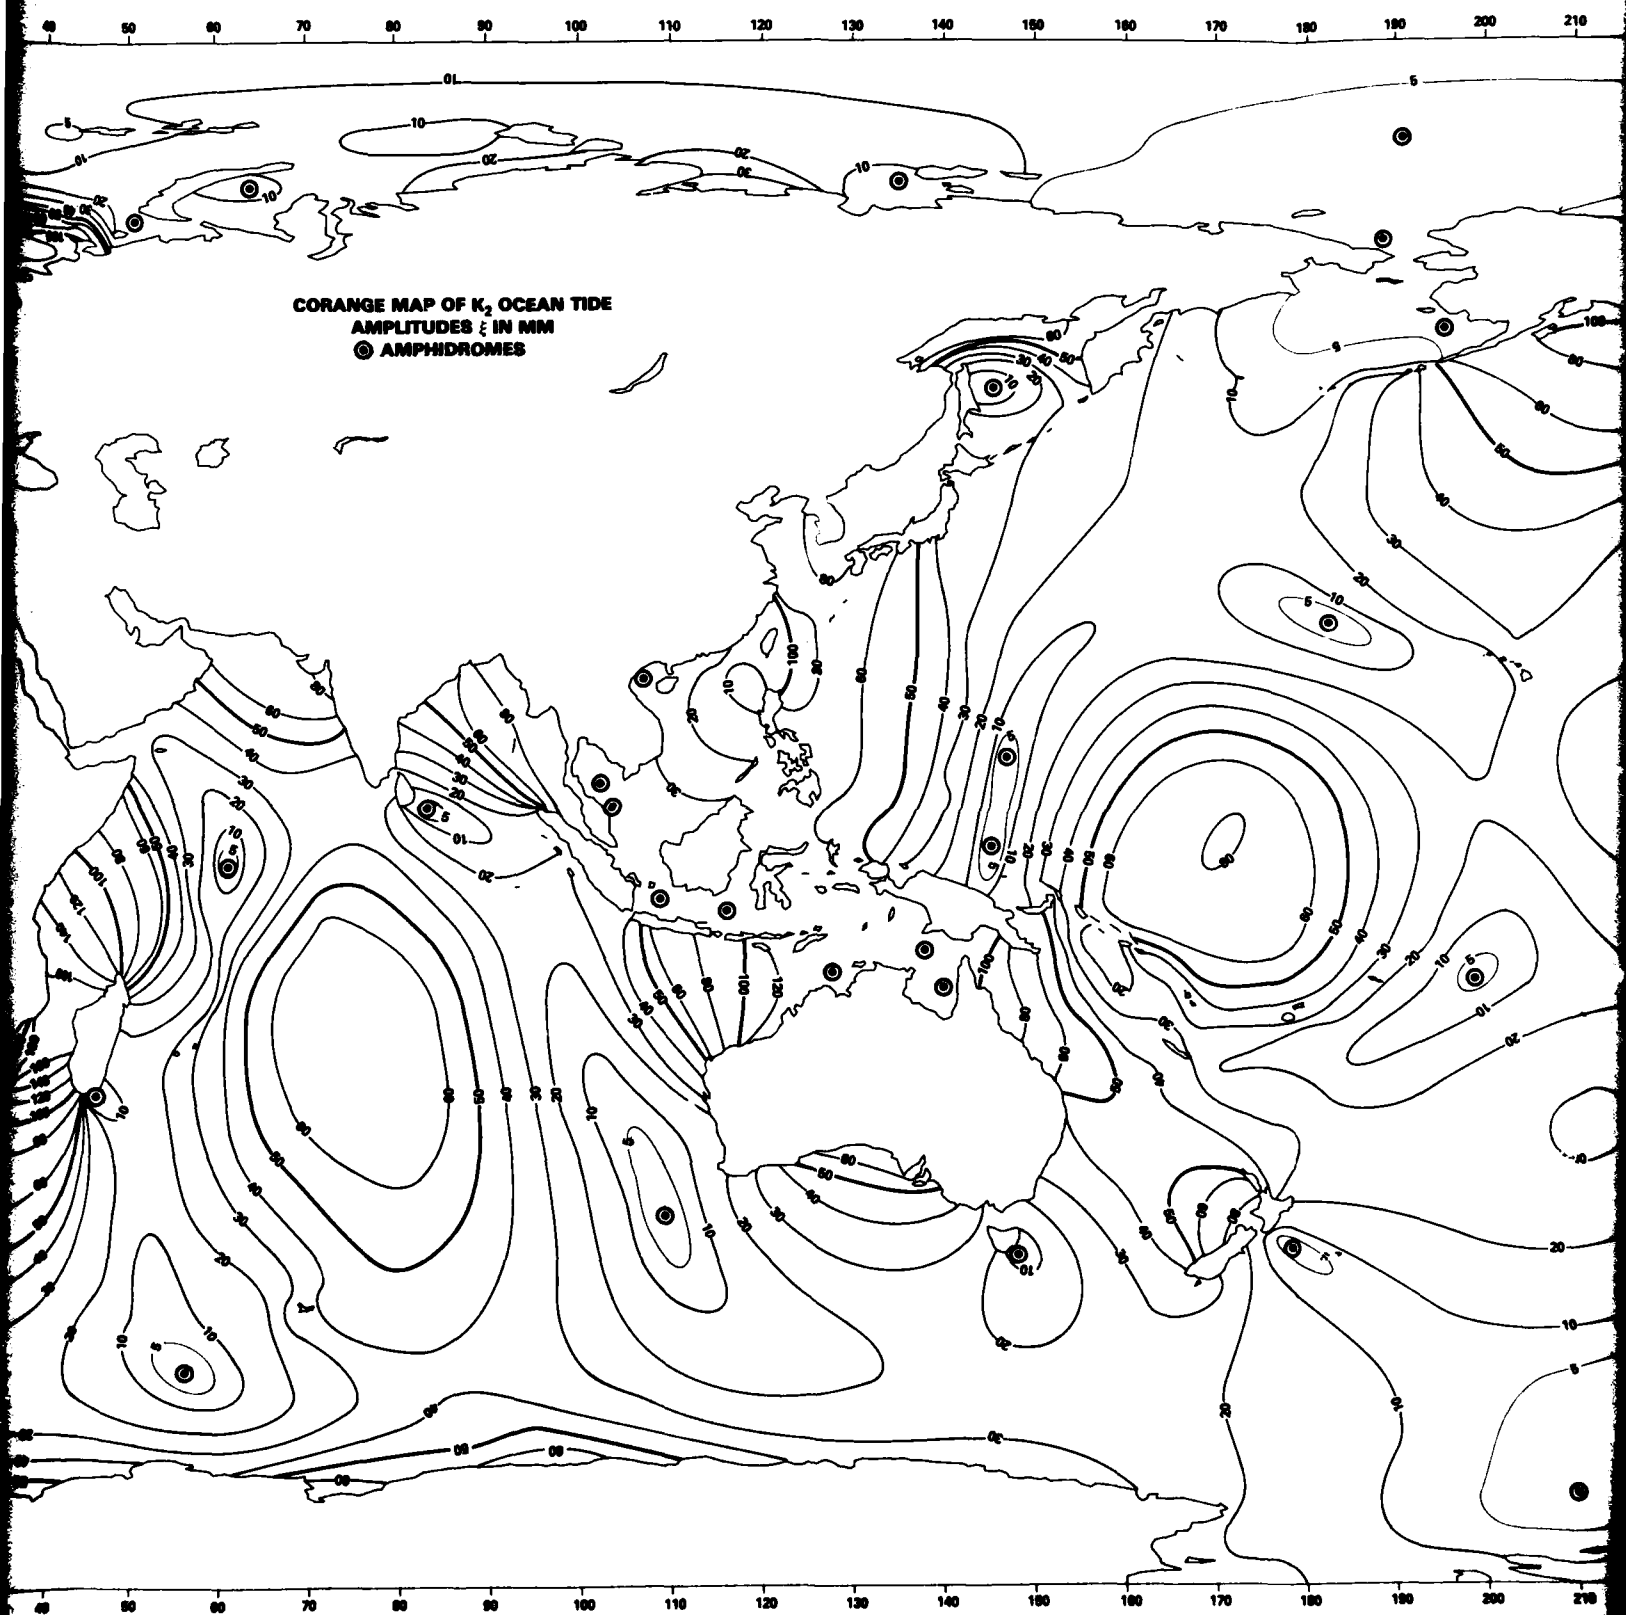

APPENDIX B

ATLAS OF CORANGE AND COTIDAL MAPS OF THE P_1 OCEAN TIDE

Amplitudes ξ of corange lines in mm.

Greenwich phases δ of cotidal lines in 15, 30, 45, 60, 75, 90, 105, 120, 135, 150, 165, 180, 195, 210, 225, 240, 255, 270, 285, 300, 315, 330, 345, 360 = 0° where $30^\circ \approx 1$ hour.
